

Minimalist Hotel Management Web Application

Responsive property management concept for desktop, tablet and mobile - without restaurant/POS

Core goal Make room status, reservations, guest stays, payments and GST simple enough for front-desk staff to operate quickly.	V1 philosophy Room-first, mobile-friendly, configurable and uncluttered. Add advanced hotel functions only when genuinely required.
--	---

1. Application Structure

Dashboard	Today's occupancy, arrivals, departures, available rooms and rooms requiring cleaning.
Rooms	Visual room board: Available, Occupied, Reserved, Cleaning and Maintenance.
Bookings	Create, edit, extend, cancel, check-in and check-out reservations.
Guests	Guest contact details and stay history.
Payments & Reports	Charges, receipts, outstanding balances, GST and operational reports.

Room workflow

Occupied -> Checkout -> Cleaning -> Available. A checked-out room should not immediately become available until housekeeping releases it.

2. Room Board & Booking Experience

101 AVAILABLE Deluxe	102 OCCUPIED Raj Sharma Checkout 11 AM	103 RESERVED Priya Mehta Arrival 2 PM	104 CLEANING Awaiting release
--	---	--	---

Clicking a room opens its guest, stay, charges, payments and operational actions. New bookings should check date overlap automatically to prevent double booking.

3. Mobile-First Design

The mobile experience should not simply shrink the desktop grid. It should use a single-column layout, large touch targets and a persistent bottom navigation.

HOME 18 Occupied 7 Available 5 Arrivals 4 Departures Search room / guest Today's Arrivals 104 - Priya Mehta - 2 PM 204 - Neha Jain - 4 PM Home Rooms + Booking Guests More	ROOM 102 OCCUPIED Raj Sharma Check-in: 6 Aug, 2:15 PM Check-out: 8 Aug, 11 AM 2 nights x Rs. 3,500 = Rs. 7,000 Paid: Rs. 4,000 Balance: Rs. 3,000 [Receive Payment] [Extend Stay] [CHECK OUT]
---	--

Recommended mobile booking flow: **Guest -> Stay -> Room -> Payment -> Confirm.** Show only rooms available for the selected dates. Tables should transform into cards rather than requiring horizontal scrolling.

4. Pricing Engine

Each room or room type has a standard tariff, but authorised users can override the rate for corporate, seasonal, promotional or walk-in pricing.

Room Rate x Nights	Rs. 7,000
- Discount	Rs. 500
+ Extra Bed / Other Charges	Rs. 0
Taxable Value	Rs. 6,500
+ GST	Rs. 780
Grand Total	Rs. 7,280
- Advance Received	Rs. 2,000
Balance	Rs. 5,280

5. GST Configuration

GST logic should be **configurable in Settings rather than hardcoded**, so rates and thresholds can be updated when tax rules change. The example below is an application-design illustration and should be validated against the GST rules applicable to the property and transaction date before production use.

Setting	Example configuration
GST enabled	Yes
Rate band 1	Up to Rs. 7,499 - 12%
Rate band 2	Rs. 7,500+ - 18%
Intra-state split	CGST + SGST
Inter-state treatment	IGST where applicable
Rounding	Configurable

6. Invoice & Payments

Generate a tax invoice at checkout with invoice number, guest details, room/stay dates, taxable charges, tax components, total, payments received and balance. A booking should support **multiple payments** such as cash, UPI, card and bank transfer.

Payment	Mode
Rs. 2,000	UPI
Rs. 2,500	Cash
Rs. 2,780	Card
Outstanding: Rs. 0	

7. Reports

Keep reporting operational: daily revenue by payment mode, occupancy, arrivals/departures, outstanding guest balances, taxable sales and GST summary. More advanced analytics can be added later.

8. Recommended V1

- Dashboard with today's operational summary
- Room master and visual room board
- Reservation with availability / overlap validation
- Check-in, checkout and cleaning-release workflow
- Guest records and stay history
- Flexible room pricing, discounts and extra charges
- GST configuration and tax invoice generation
- Multiple payment modes and outstanding balance tracking
- Mobile-responsive interface / installable PWA
- Basic revenue, occupancy, GST and outstanding reports

Suggested architecture: a responsive web/PWA front end with a relational database. Keep room types, pricing rules, tax settings, payment modes and user permissions configurable so the same product can serve different properties.
